isotope is therefore designated by $_{43}Tc^{99}$. The state of affairs is similar for element 61. This element, too, was believed to have been discovered in certain minerals, and it was named *illinium.* But, again, the discovery could not be confirmed. It is practically certain that neither of these elements exists in stable form.

Nuclear Transmutations and their Application in Chemistry

But since it is possible to produce these elements, in radioactive varieties at least, it is possible also to produce chemical reactions with them.
