- `int`
- `float`
- `string`
- `array`
- `object`

The following pseudo-types can be declared with functions.

- `false`
- `true`
- `callable`
- `never` (return-only)
- `void` (return-only)
- `mixed`
- `callable`

Finally, these are the supported class (user-defined) types.

- Class name
- Interface name
- Enum name

How to Declare Types

To define the data type of values returned by a function, put a colon after the closing parenthesis followed by the type keyword. For example, the `function getNumber(): integer`. Here are some examples of return type declarations; output is omitted, but see comments for detail:

```
function sayHi(): string
{
    return "Hi there!"; // valid return
}
```
