We can remove a fixed number of elements starting at the offset by passing a positive integer:

```
$myArr1 = ["Alice", "Bob", "Russell"];
$myArr2 = ["Rita", "Sue"];

array_splice($myArr1, 1, 1, $myArr2); // offset = 1, length = 1
print_r($myArr1);

Output:
Array
(
    [0] => Alice
    [1] => Rita
    [2] => Sue
    [3] => Russell
)
```

There are more permutations of offset and length that can achieve other outcomes such as starting the offset from the end of the array, or removing elements from offset until a fixed number of positions from the end of the array. Full documentation for the function can be found at https://www.php.net/manual/en/function.array-splice.php.

Combining into Associative Arrays

PHP offers the capability to easily create associative arrays using two other arrays of equal length: one for keys and the other for values. The use cases might be marginal, but it will save time and effort if it ever becomes necessary.

```
$keys = [
    'title',
    'year',
];

$albums = [
    ['A Night at the Opera', '1975'],
    ['A Day at the Races', '1976'],
];
```
