```
$assocArr = [];
foreach ($albums as $album) {
    if (count($keys) === count($album)) {
        $assocArr[] = array_combine($keys, $album);
    }
}

print_r($assocArr);

Output:
Array
(
    [0] => Array
        (
            [title] => A Night at the Opera
            [year] => 1975
        )

    [1] => Array
        (
            [title] => A Day at the Races
            [year] => 1976
        )

)
```

We loop over `$albums` and test that the number of elements is equal to the number of keys (if the two arrays provided to `array_combine()` are of different sizes, it will return `false` and emit an E_WARNING error). If the test passes, `array_combine()` generates a new associative array, which is then added to `$assocArr`.

Replacing Elements with `array_replace()`

It is possible to selectively overwrite elements of an array with elements of another, using the built-in `array_replace()`.
