Sorting Arrays

It is not uncommon to want to process arrays in value or key order: perhaps the data simply needs to be rendered in numerical or alphabetical order, or maybe you're implementing an algorithm that works best on sorted data. Whatever the reason, PHP has you covered.

By Value

To arrange elements in an array by ascending value order, we can use the built-in function `sort()`. `sort()` also has a counterpart, which will sort in descending order: `rsort()`. By default elements are compared using standard comparison, but this behavior can be modified. Let's take a look at a simple example:

```
$numbers = [1.2, 1, 10, 5];
$words = ['foo', 'Bar', 'BAR', 'Foo'];

sort($numbers);
sort($words);

print_r($numbers);
print_r($words);

Output:
Array
(
    [0] => 1
    [1] => 1.2
    [2] => 5
    [3] => 10
)
Array
(
    [0] => BAR
    [1] => Bar
    [2] => Foo
    [3] => foo
)
```
