Sorting by Callback

To sort an array using your own callback function, you can use the built-in functions `usort()`, `uasort()`, and `uksort()`. If you remember from the section "Comparing Arrays" there were callback handling functions like `array_uintersect()`. These three sorting functions work in a very similar way. You should hopefully be comfortable by now with the idea of a callback being used to sort arrays because, as we learned, the callbacks for `array_uintersect()` et al. were used for both comparison *and* sorting. This is no different. Nevertheless, a quick example is called for, so here we go:

```
$tele = new stdClass();
$tele->model = 'Fender Telecaster';
$tele->year = 1958;

$strat = new stdClass();
$strat->model = 'Fender Stratocaster';
$strat->year = 1962;

$jem = new stdClass();
$jem->model = 'Ibanez Jem 777';
$jem->year = 1988;

$guitArr = [$strat, $jem, $tele];

usort($guitArr, function ($a, $b) {
    return $a->year <=> $b->year;
});

print_r($guitArr);

Output:
Array
(
    [0] => stdClass Object
        (
            [model] => Fender Telecaster
            [year] => 1958
        )
```
