```
    public static function getInstance($quote): self
    {
        if (self::$instance === null) {
            self::$instance = new self($quote);
        }

        return self::$instance;
    }

    public function getQuote(): string
    {
        return $this->quote;
    }
}

$bot1 = SingleQuoteBot::getInstance(
    "Of all the gin joints in all the towns in all the world, she walks
    into mine"
);
$bot2 = SingleQuoteBot::getInstance("any old nonsense.");

print $bot1->getQuote() . PHP_EOL;
print $bot2->getQuote() . PHP_EOL;

Output:
Of all the gin joints in all the towns in all the world, she walks
into mine
Of all the gin joints in all the towns in all the world, she walks
into mine
```

By storing the first `SingleQuoteBot` instance in a static class variable and only creating it once if it doesn't exist already, we've set up the `SingleQuoteBot` class to have a single instance. Even though we try to build a second bot with a different quote, the `getInstance()` method (in this example it is known by the name "factory method") when we call the second object's `getQuote()` we get the original text. Every "object" returned from the factory method is in fact a reference to the same object instance.
