Interface Constants

Interfaces are also permitted to declare constants. These will become class constants wherever the interface is implemented; here's a quick example:

```
interface QuoteBotInterface
{
    public const QUOTE = 'I am not a number! I am a free man!';
}

class GenericBot implements QuoteBotInterface
{
}

class LebowskiBot implements QuoteBotInterface
{
    public const QUOTE = "I'm a writer, you monsters! I create!";
    // only since PHP 8.1
}

print GenericBot::QUOTE . PHP_EOL;
print LebowskiBot::QUOTE . PHP_EOL;

Output:
I am not a number! I am a free man!
I'm a writer, you monsters! I create!
```

Note that overriding a `const` declared in an interface is only possible from PHP 8.1 onwards.

Property Hooks

The new hotness in PHP 8.4 is property hooks. We've seen how to implement them in class declarations, and they can also be defined in interfaces. Interfaces do not normally allow the definition of properties, but hooked properties are an exception to that rule. Where an implementing class is required to provide hooks, add braces containing the required hooks, each followed by a semicolon:
