```
class SaturnFive extends Rocket
{
    protected int $fuelLevel = 500_000;
}
```

Extension and Constants

Like interfaces traits can declare constants, if running PHP 8.2 or later:

```
trait DefaultQuote
{
    // requires PHP 8.2
    public const QUOTE = 'I am not a number! I am a free man!';
}

class GenericQuoteBot
{
    use DefaultQuote;
}

print GenericQuoteBot::QUOTE . PHP_EOL;
```

```
Output:
I am not a number! I am a free man!
```

Unlike interfaces, it is not possible to extend a trait: there is no inheritance hierarchy. Traits really are just a mechanism for expanding a short statement into a chunk of source code (a little like macros in C), they transform your code *before* it is interpreted. There is, however, a trick for "extending" a trait by pulling one trait's code into another:

```
trait DefaultQuote
{
    private const QUOTE = 'I am not a number! I am a free man!';
}

trait GetQuote
{
    use DefaultQuote;
```
