```
Array
(
    [level] => 1
)
```

Note that `get_class_methods()`, `get_class_vars()`, and `get_object_vars()` only return information about public members when called from outside the class. Additionally, `get_object_vars()` and `get_class_vars()` are specific to objects and classes, respectively.

If called from inside the class, the protected and private members are also returned. If we add the following method to the `Wizard` class…

```
public function showMembers(): void
{
    print_r(get_class_vars(self::class));
    print_r(get_class_methods($this));
}
```

… we can see all properties and methods regardless of visibility.

```
(new Wizard())->showMembers();

Output:
Array
(
    [level] => 1
    [exp] => 0
)
Array
(
    [0] => magicMissile
    [1] => longRest
    [2] => showMembers
)
```
