Going back to our nginx web server (for which we're using the same resources found in the "Web Server Integration" section of Chapter 1, "Getting Started"), we're now going to update the main nginx config file (`default.conf`). Here's that file with a few alterations:

```
server {
    listen 0.0.0.0:80;
    root /var/www/html;
    location / {
        try_files $uri /index.php$is_args$args;
    }
    location ~ ^/index\.php($/|$) {
        include fastcgi_params;
        fastcgi_pass php-fpm:9000;
        fastcgi_index index.php;
        fastcgi_param SCRIPT_FILENAME $document_root/$fastcgi_script_name;
    }
}
```

The main difference is the `location /` block, which used to contain `index index.php index.html;` – this simply told the server that requests for the root path should be mapped to `index.php` or `index.html`. Now we have a `try_files` directive set up to fall back to `index.php` if it cannot find a file that maps to the requested resource. We'll use a slightly tweaked `docker-compose.yaml` file here to force Docker to build us a new image:

```
version: "3"
services:
  nginx:
    build:
      context: .
      dockerfile: ./Dockerfile
    image: paultregoing/nginx:http_routing
    ports:
      - "8080:80"
    networks:
      - internal
    volumes:
      - ./:/var/www/html
```
