Note that the convention of adding `X-` to "custom" headers is officially deprecated, but you will see it used in abundance even today. If you are running the `cli-server` SAPI or any flavor of the Apache SAPI, PHP provides the `getallheaders()` convenience function for obtaining request headers:

```
// index.php
var_dump(getallheaders());
$ curl -H 'X-Custom-Header: some value' http://localhost:8080/index.php
array(4) {
  ["Host"]=>
  string(14) "localhost:8080"
  ["User-Agent"]=>
  string(10) "curl/8.7.1"
  ["Accept"]=>
  string(3) "*/*"
  ["X-Custom-Header"]=>
  string(10) "some value"
}
```

One thing to note: the HTTP specification allows for multiple instances of a field in the headers. We can demonstrate this by writing another PHP script to request the one we've been using up to now, and it also serves as a handy demo for writing your own socket-level HTTP requests in PHP code:

```
$opts = ['http' => [
    'method' => 'GET',
    'header' => [
        'User-Agent: PHP',
        'X-Foo: foo',
        'X-Foo: bar',
    ],
]];

$res = file_get_contents(
    filename: 'http://localhost:8080/index.php',
    context: stream_context_create($opts)
);
```
