```
    <anna/>
    <paul/>
  </humans>
  </data>' \
  'http://localhost:8080/index.php'

object(SimpleXMLElement)#2 (2) {
  ["animals"]=>
  object(SimpleXMLElement)#3 (1) {
    ["cat"]=>
    object(SimpleXMLElement)#5 (1) {
      ["jess"]=>
      object(SimpleXMLElement)#6 (0) {
      }
    }
  }
  ["humans"]=>
  object(SimpleXMLElement)#4 (2) {
    ["anna"]=>
    object(SimpleXMLElement)#5 (0) {
    }
    ["paul"]=>
    object(SimpleXMLElement)#6 (0) {
    }
  }
}
```

There will be more to come on handling HTML and XML data in PHP later in the chapter.

Uploading Complex (and Binary) Data

As mentioned previously in this section, the `multipart/form-data` request media type (as specified via the `Content-Type:` header) should be used for transmitting complex and/or binary request data to a server. In fact, this particular media type will also allow you to mix different data types into a single request: you can upload an image, send JSON or other text, and so on. The default behavior of a web browser using an HTML
