```
  -F 'humans[]=paul' \
  http://localhost:8080/index.php

array(1) {
  ["file"]=>
  array(6) {
...
array(2) {
  ["animals"]=>
  array(1) {
    ["cat"]=>
    string(4) "jess"
  }
  ["humans"]=>
  array(2) {
    [0]=>
    string(4) "anna"
    [1]=>
    string(4) "paul"
  }
}
```

... and now our `$_POST` array makes a lot more sense! Generally speaking, when making multipart requests with curl, you should break up POST data strings wherever you encounter an `&` character in the `form-urlencoded` string.

It is also possible to upload files using the PUT request method, and, in some respects, it is a much simpler way of doing things. A raw PUT request will usually look something like this...

```
PUT /index.php HTTP/1.1
User-Agent: <user agent>
Accept: <accepted response media types>
Content-Length: <length of file in bytes>
<binary data>
```
