```
// ... $xml, $dom, and $xpath init as before
$results = $xpath->query(
    '//project[contains(@class, "code")]'
);
print "Found {$results->length} matching node(s)" . PHP_EOL;
var_dump($results[0]->textContent);
```

```
Output:
Found 1 matching node(s)
string(9) "Lovely JS"
```

You won't (normally) need to do this with `id` because well-formed HTML does not have multiple elements with the same `id` value.

Predicate Operators and Functions

We've seen one operator in action already, `[@class="first_para"]` using the `=` relational operator to compare an attribute value to a string. There are other relational operators, arithmetic, and logical operators too. They mostly align with the same operators in PHP, so you should hopefully recognize them (Tables 11-14, 11-16, and 11-15).

Table 11-14. *XPath relational operators*

Operator	Meaning
=	Equals
!=	Not equals
<	Less than
>	Greater than
<=	Less than or equal
>=	Greater than or equal
