Tests

The `is` keyword (which can be negated to `is not`) is used to form an expression with a value as the left operand and a sub-expression as the right. The right-hand sub-expression is usually formed using one of the following words:

Table 11-34. *Twig test sub-expressions*

`defined`	Variable is defined
`divisible by N`	Variable divides by N (equivalent to `var % N == 0`)
`empty`	Equivalent to PHP's `empty()` (with all the attendant type coercion problems)
`even`	Variable is an even number
`iterable`	Variable is a sequence or mapping
`null`	Variable is null
`odd`	Variable is an odd number

For example, to render template section if `myVar` is not an empty string, empty sequence/mapping, `false`, or `null` use `{% if myVar is not empty %}`.

String Tests

Table 11-35. *Twig string tests*

`starts with`	`true` if lefthand string begins with characters of righthand string
`ends with`	`true` if string ends with specified characters
`matches`	Test a string with a regular expression

The following template snippet demonstrates the last five items in the table, all of the expressions shown below evaluate to `true`:

```
{# views/comparison-expressions.txt.twig #}
{{ 'Jess the cat' matches '/^[Jj]ess/' }}
{{ 'abcdef' starts with 'abc' }}
{{ 'abcdef' ends with 'def' }}
```
