Table 11-38. *Twig* `include` *options*

Option	Default	Effect
`ignore_missing`	`false`	Render empty string instead of emitting error if target not found
`sandboxed`	`false`	Requires `SandboxExtension`, used to restrict functionality in untrusted templates
`with_context`	`true`	Control exposure of calling template's context (variables)

Time for a quick demo:

```
// index.php
print $twig->render('include-demo.html.twig');
```

This time we'll need two templates, the one that `TwigEnvironemnt::render()` will parse first…

```
{# views/include-demo.html.twig #}
<!DOCTYPE html>
<html>
    {% set pageTitle = 'Twig include() demo.' %}
    {{ include(
        'inc/head.html.twig',
        {title: pageTitle},
        with_context: false,
        ignore_missing: true
    ) }}
  <body></body>
</html>
```

… and the one that the first template includes, which needs to be saved in a `views/inc` sub-directory (remember that we're initializing an instance of `Twig\Loader\FilesystemLoader` with a `__DIR__ . 'views'` argument, so the full path to this sub-template will be `views/inc/head.html.twig` relative to your project root):

```
{# views/inc/head.html.twig #}
<head>
  <title>{{ title }}</title>
</head>
```
