```
    }

    return $next($request);

}
```

Then, apply it in your routes like so:

```
Route::group(['middleware' => ['auth', 'role:admin,editor']], function () {

    Route::get('/management', [App\Http\Controllers\ManagementController::class, 'index'])->name('management.index');

});
```

This structure lets you define a hierarchy of permissions, ensuring that both admins and editors can access the management section.
