Given below is a quick sample:

```
Schema::table('users', function (Blueprint $table) {
    $table->text('two_factor_secret')->nullable();
    $table->text('two_factor_recovery_codes')->nullable();
});
```

Then, run the migration to update your database:

```
php artisan migrate
```

After that, modify your user model to use the **TwoFactorAuthenticatable** trait provided by Fortify. This can be done by opening the **app/Models/User.php** and adding the following:
