```
    // other features...

    Features::twoFactorAuthentication([

        'confirmPassword' => true,

    ]),

],
```

This setting ensures users must confirm their password when enabling or disabling 2FA. If you are using Laravel Breeze or another frontend scaffolding that integrates with Fortify, the two-factor authentication views will be available automatically. Otherwise, you may need to create your views or refer to Fortify's documentation for customizing the two-factor user interface.

After all this, then you need to start your development server:
