database/migrations folder. The file name begins with a timestamp, which helps maintain the order of migrations.

Customizing Migration File

Next, open the newly generated migration file in our IDE. You will see a structure with **up()** and **down()** methods. In the **up()** method, define the schema for the "comments" table as shown in the following example:

```
public function up()

{

    Schema::create('comments', function (Blueprint $table) {

        $table->id();

        $table->foreignId('post_id')->constrained()-
>onDelete('cascade');

        $table->string('author');

        $table->text('content');
```
