}

In the above, a closure is used to check if the **username** contains any banned words. If a match is found, the **$fail** callback triggers with a custom error message.

Developing Tailored Error Messages

While the Laravel automatically generates error messages for standard rules, custom validations allow you to provide targeted and clear feedback for users. In the custom validator defined above, we've given specific details like the prohibited word that was detected. To further enhance usability, you could also define custom error messages in a language file or directly within the validation call using the second parameter of the **validate()** method as shown in the following script:

```
$messages = [

    'username.required' => 'Please provide a username.',

    'username.max'      => 'Your username should not exceed
```
