## Recipe 3: Centralized Exception Handling

After a while, you figured out that unexpected errors and exceptions are bound to pop up when there's a ton of traffic and a lot of people are engaged. To deal with these issues head on, you decided to centralize exception handling by setting up Laravel's built-in exception framework. Today, we will learn how to use the Handler class to capture, log, and format errors consistently. This approach makes sure that every exception is managed in one place, making your application robust and easier to debug, while maintaining a user-friendly interface even when errors occur.We will be working in our usual Laravel environment on Linux, using PhpStorm and Laravel Debugbar to help us figure out any problems.

### Customizing Report Method

Every Laravel project includes a central exception handler located at This file contains two primary methods: **report()** and The **report()** method is responsible for logging the exception details, while **render()** is tasked with returning a suitable response to the user.

First, open the **app/Exceptions/Handler.php** in PhpStorm and you
