messages, warnings, and performance data, so you can see trends and anomalies over time. With this tool, we will have a single dashboard that provides an at-a-glance view of the application's health and a detailed log of events, making it easier to diagnose issues as they occur in production.

So now, to add Laravel Pulse to your "myapp", we need to run the similar Composer command as we did previously for all the other tools:

---

composer require laravel/pulse

The Laravel's package auto-discovery takes care of registering the Pulse service provider, so there's no need to manually edit your Once done, publish the configuration file and assets by running:

---

php artisan vendor:publish --
provider="Laravel\Pulse\PulseServiceProvider"
