```
            'user_id' => auth()->id(),

            'action' => 'processData'

        ]);

    }

}
```

---

This explicit logging sends crucial error details to the Pulse log, and due to this, all these issues are visible in the monitoring dashboard.

For instance, if a critical error happens repeatedly, your Pulse dashboard will show a spike in error frequency. This visual indicator alerts you to a potential systemic issue that might require immediate attention, such as a bug in the data processing logic or a misconfiguration in a third-party API integration. In parallel, you can use Laravel Debugbar (which is already integrated into in our myapp) to cross-check the number of queries and performance metrics.
