```
        'slack'      => [

            'webhook_url' => env('SLACK_WEBHOOK_URL'),

        ],

    ],

],
```

After setting this configuration, any log message designated as critical will trigger an alert. When the simulated error occurs during testing, your designated channels (such as email or Slack) will receive a notification, prompting your team to investigate immediately.

Once you have set up Laravel Pulse and customized alerts, it becomes a continuous process to monitor the Pulse dashboard. This system not only captures detailed logs and error events but also aggregates them on an intuitive dashboard, enabling your development team to swiftly track and resolve issues as they arise.
