```
php artisan notifications:table

php artisan migrate
```

This creates a **notifications** table in your database to store incoming notifications.

Creating Custom Notification In-App Alerts

We now create a custom notification that will be used as an in-app alert by running the following command:

```
php artisan make:notification UserAlertNotification
```

This command creates a new file at app/Notifications/UserAlertNotification.php. Now, to implement the notification, first open the generated notification file and update it to use the **toDatabase** method.

For in-app alerts, we want the notification's data stored in the
