Recipe 2: Configuring Email & SMS Notifications

Let us say that you realized that your users also need to be alerted to important events outside of the app. Your team discussed that email notifications and SMS alerts would be valuable for critical updates, such as account security warnings or transactional alerts, ensuring users stay informed wherever they are. So here, you will learn how to configure and send notifications through these channels using Laravel's native tools. We will create a notification class for important events, set up the necessary configurations in our Linux environment, and demonstrate how Laravel sends email messages and SMS alerts.

Creating Notification Class

We first start with the generation of a new notification class called **ImportantEventNotification** using the Artisan command as below:

```
php artisan make:notification ImportantEventNotification
```
