This command creates a file at which you will use to define how the notification is sent through different channels.

Implementing Email and SMS Notification Channels

You now open the previously generated file in PhpStorm and update the class so that it sends notifications via both email and SMS using Laravel's built-in channels as shown below:

```
namespace App\Notifications;

use Illuminate\Bus\Queueable;

use Illuminate\Notifications\Notification;

use Illuminate\Notifications\Messages\MailMessage;

use Illuminate\Notifications\Messages\NexmoMessage; // Use VonageMessage if on Laravel 9+
```
