```
        $eventDetails = ['Security Issue', 'Action Required'];

        // Trigger the notification.

        $user->notify(new
ImportantEventNotification($eventMessage, $eventDetails));

        // Provide feedback to the user or redirect.

        return redirect()->back()->with('status', 'Notification sent
successfully!');

    }

}
```

In the above code, when the **alertUser** method is invoked, the currently authenticated user receives an email and an SMS notification. The notification contains a subject, greeting, message details, and a call-to-action in the email, while the SMS carries a concise alert.

While the demonstration above shows a basic implementation,
