```
php artisan make:event NewChatMessage
```

This command generates a new event class in the **app/Events** directory called Now we want to implement this event for which we need to open the generated file **app/Events/NewChatMessage.php** and update it to implement the ShouldBroadcast interface. After doing this, it makes the event broadcastable.

Your event class shall be looking like this:

```
namespace App\Events;

use Illuminate\Broadcasting\Channel;

use Illuminate\Queue\SerializesModels;

use Illuminate\Broadcasting\InteractsWithSockets;

use Illuminate\Contracts\Broadcasting\ShouldBroadcast;
```
