```
    public function sendMessage(Request $request)

    {

        $message = $request->input('message');

        $sender = auth()->user()->name;

        // Fire the event to broadcast the chat message.

        event(new NewChatMessage($message, $sender));

        // Optionally, return a JSON response.

        return response()->json(['status' => 'Message sent and
broadcasted!']);

    }

}
```

When this method is invoked, the event is fired and broadcast
