**Recipe 4: Monitoring System Performance Metrics**

So now from this point, you've got to start keeping a close eye on how your app is performing. This'll help you make sure it can handle more traffic and data processing loads without breaking a sweat. When you did your stress tests recently, you saw that some requests were taking longer than expected and your database queries were using a lot of memory. These performance issues mean you've got to keep a close eye on key metrics like execution times, memory usage, and query loads.

Launching Laravel Telescope

We start with verifiying that you've already published Telescope's assets. If not, then we try the following:

---

php artisan telescope:install

php artisan migrate

---
