htop

If htop is installed, it provides a more visual representation of resource usage.

---

sudo iotop -o

This command monitors disk I/O in real time (if available).

While Telescope and Debugbar capture the application metrics, use **top** or **htop** in a separate terminal window to see if your CPU load or memory consumption spikes correspond with the slow requests. For real-time comparisons, note down the application metrics from Telescope and match them against your system-level readings.
