This code offloads the heavy task, ensuring the user's request is processed quickly while the task runs in the background.

Processing Queue with Linux Commands

Starting Queue Worker

To process queued jobs, you must run the queue worker. In your Linux terminal within the "myapp" directory, you then execute:

---

php artisan queue:work

This command starts processing jobs from the **jobs** table. As jobs are dispatched, the worker picks them up and executes the **handle()** method.

Monitoring Worker

Keep the terminal session running to monitor the worker's
