output. You should see log messages confirming that your heavy task was processed. If you wish to stop the worker, simply press **Ctrl +**

For production environments, try using a process manager like Supervisor to manage your queue workers automatically. However, for this demonstration, running the command manually is sufficient.

You can follow the below Supervisor configuration snippet:

[program:laravel_queue_worker]

process_name=%(program_name)s_%(process_num)02d

command=php /path/to/myapp/artisan queue:work --sleep=3 --tries=3

autostart=true

autorestart=true

user=your_linux_user
