numprocs=1

redirect_stderr=true

stdout_logfile=/path/to/myapp/storage/logs/queue.log

With this, you learned what queue drivers are and how they help offload heavy tasks, thereby improving your application's responsiveness. You set the queue connection to 'database,' created the required migration, and dispatched a sample job that simulates a heavy task. And then, you processed the queued job using Linux commands, confirming the successful offloading and execution of tasks in the background.
