```
        // Assume a report identifier is passed as input
        $reportId = $request->input('report_id', 1);

        // Dispatch the report generation job to the queue
        GenerateReportJob::dispatch($reportId);

        // Respond quickly to the user indicating the process has started
        return response()->json(['message' => 'Report generation initiated. It will be available shortly.']);
    }
}
```

This above dispatches **GenerateReportJob** with the given report ID, and the job is placed on the queue and processed asynchronously, keeping the HTTP request-response cycle fast.
