```
            throw $e;

        }

    }

}
```

In the above script,

The **$tries** property ensures that the job is retried up to five times before it is marked as failed.

- The **$timeout** property sets the maximum time allowed for the job to run.

Within the **handle()** method, transient errors are simulated and captured. So, if an exception occurs, the job logs the error and re-throws it so that Laravel's queue system can attempt a retry.

Monitoring and Logging Failed Jobs
