```
        return response()->json(['message' => 'Report generation initiated.']);

}
```

Since our sample job includes a random error throw, we need to repeatedly trigger the job until you see it retried. And while you do, you keep monitoring the terminal where you run the queue worker:

```
php artisan queue:work
```

You should see log messages from the worker indicating retries. After exhausting retries, the job will be recorded in the **failed_jobs** table.

After the log file to confirm that errors were logged appropriately and then run:
