Overview

In this chapter, we will walk through setting up a Linux-based development environment just for Laravel 11. We will start by updating your Linux system and installing PHP 8.0 along with its required extensions. Then, set up Composer to manage your dependencies and install Laravel version 11, which will help keep your project framework organized. We will learn how to set up important environment variables and create an application key for security.

We will also learn about the importance of Laravel's directory layout and how to manage file permissions to keep things secure and running smoothly. We will also get a solid set of tools for development, like PhpStorm, Laravel Debugbar, and Telescope. These will make your workflow and debugging process better. Finally, we will set up Git version control, create commit conventions, and configure remote repositories to enable seamless collaboration with your team. It'll give you all the essential skills you need to get started in Laravel development with confidence and precision.
