Before integrating the command with the Scheduler, test it manually by running:

```
php artisan logs:clear
```

The output should indicate that the logs have been cleared successfully. Check your **storage/logs** directory afterward to verify that the log files were deleted.

Scheduling Custom Command

The Laravel Scheduler requires a single cron entry to execute the **schedule:run** command every minute. This entry triggers the Scheduler, which in turn executes all tasks that are due. Now to do this, you edit your crontab with following change to the crontab file:

```
crontab -e
```

```
* * * * * cd /path/to/myapp && php artisan schedule:run >> /dev/null 2>&1
```
