This line ensures that every minute, Laravel checks for due tasks as defined in **Kernel.php** and executes them accordingly.

Now, to verify that your scheduled tasks are running, you can monitor the Laravel log file. Another approach is to modify the **ClearLogs** command temporarily to log a message each time it runs, then wait for the next scheduled minute and check if the message appears.

Advanced Scheduler Features

The Laravel Scheduler supports custom CRON expressions, giving you complete control over the frequency of task execution. For example, if you need a task to run every five minutes, you can define:

```
$schedule->command('reports:generate')->cron('*/5 * * * *');
```

This flexibility let you to fine-tune how often tasks run based on your application's requirements and server capacity. As your application grows, you can add multiple commands and even
