default disk configuration is defined in the **config/filesystems.php** file, where Laravel defines the default disk as “local” and provides settings for the “public” disk. By default, files are stored in the **storage/app** directory with public files typically served via symbolic links in However, you can configure alternative storage paths and customize the disk configuration to meet your application’s security needs.

So to begin with, first open the file **config/filesystems.php** in PhpStorm. Here, we will see a configuration array for disks. The default “local” disk is typically defined as:

```
'local' => [

    'driver' => 'local',

    'root' => storage_path('app'),

],
```

Now to manage media files securely, you might create a new disk specifically for media assets. So just add a new disk
