For files intended to be served to end users, create a controller method that retrieves the file from the private media disk and returns it via a response.

```
use Illuminate\Support\Facades\Storage;

public function getMediaFile($filename)

{

    // Ensure that the user is authenticated and authorized to access the file

    if (!auth()->check()) {

        abort(403);

    }

    $path = 'media/' . $filename;
```
