```
    if (!Storage::disk('media')->exists($filename)) {

        abort(404);

    }

    return response()->file(Storage::disk('media')->path($filename));

}
```

This checks if a media file exists in the private disk and then securely streams it to the user.

Practical Upload and Retrieval Operations

Uploading Media Files to Private Disk

To implement the file upload, we first open the media controller and write an upload method to handle file uploads securely as below:
