```
Route::post('/media/upload',
[App\Http\Controllers\MediaController::class, 'upload'])-
>name('media.upload');
```

This route will be used to trigger the file upload operation.

Retrieving Media Files Securely

As noted earlier, we need to create a method in your **MediaController** to securely retrieve a file as shown below:

```
public function download($filename)

{

    // Validate user authentication or other access rights here

  if (!auth()->check()) {

      abort(403);
```
