Recipe 2: Automating Image Processing and Optimization

As your app got bigger, you realized that processing images was becoming super important. It was essential to manage image files effectively, whether for user-uploaded photos, product images, or profile pictures. Your team talked about how automating tasks like resizing, cropping, and improving image quality could boost performance and give users a more consistent experience. You decided to use the Intervention Image library to deal with this issue. It's a solid solution for handling images in PHP. This'll let your app adjust images based on predefined dimensions and quality parameters, making sure all images are stored and displayed properly.

Installing Intervention Image Library

We can easily install the Intervention Image package using composer as below:

---

composer require intervention/image
