Here, the method validates that an image file is provided and ensures the file does not exceed 5MB. The uploaded image is captured from the request and a unique filename is generated using the current timestamp. This helps prevent file collisions.

The Intervention Image facade creates an image instance from the uploaded file. The image is then resized to a maximum width of 800 pixels while maintaining the aspect ratio. The upsize constraint prevents small images from being stretched unnecessarily. The image is encoded into JPEG format with reduced quality (75%) to optimize file size while preserving visual quality. Adjust the quality parameter as needed based on your requirements.

Finally, the processed image is stored in the secure local storage disk ("media") defined in your Laravel configuration. This keeps your images isolated from the public directory unless explicitly served via a secure controller.

Setting up Route

To do this, we define a route to handle the image upload and processing. For this, we open the **routes/web.php** file and add the following:
