Both these methods are optimized to handle large files by streaming the file in chunks rather than loading it all into memory at once. And this is of much importance for high-traffic scenarios, as it minimizes server memory usage and improves response times.

Implementing Efficient File Streaming

Creating Controller Method for File Streaming

In your add a method dedicated to streaming files. This method will retrieve the file from your secure **media** disk and stream it to the client.

```
namespace App\Http\Controllers;

use Illuminate\Support\Facades\Storage;

use Illuminate\Http\Request;

class MediaController extends Controller
```
